WASHINGTON**

VOLUME 17

NUMBER 6

National Income

INCREASED IN 1936

by a larger amount, absolutely and relatively, than in 1935. Income produced rose to 63.8 billion dollars, an increase of 8.8 billion dollars over the 1935 total. All major groups showed increases in 1936 over the preceding year, with the largest percentage gains being in the construction, mining, and manufacturing industries. . . . National income paid out rose 7.4 billion dollars in 1936 to 62.1 billion dollars. Compensation of employees increased nearly 5 billion dollars, and labor's share of the total remained at the high figure reached in 1935. Dividends increased 1½ billion dollars, or nearly 50 percent, over those for 1935.

Recent changes in the flow of national income are discussed in the article on page 11 by Robert R. Nathan, Chief of the National Income Section of the Division of Economic Research. Comparative data for the period 1929 to 1936, inclusive, are presented in the article.

FARM EQUIPMENT BUSINESS— HIGHEST SINCE 1929—

reflects the continued rise in farm income and the amount of that income which is available for capital expenditures. Equipment manufactured in 1936 had a value of \$487,273,000, about four times the value of the production for 1932.

Recent trends in the industry are discussed in the review on page 16.

Business Indicators

1923-25=100, except as noted

Business Situation Summarized

Manufacturing output has been maintained at a relatively high rate during May as continued progress in certain industries, mainly those producing durable goods, has compensated for the tendency for operations to slacken in other lines. The volume of incoming business in some industries has declined since March, particularly where price advances earlier in the year caused an unusual volume of forward buying. That sales in numerous industries have continued to expand is evident from reports of manufacturers of machine tools, railroad equipment, lumber, paints and varnishes, rubber products, and petroleum products. Steel and textiles are two major industries in which the rate of incoming business has fallen off, but this has not affected materially the rate of operations because of the large volume of unfilled orders carried over from the first quarter.

Steel production was sustained around 90 percent of capacity until the final week of May. Automobile production, which reached 536,000 units in April, was held at a steady rate during May. Cotton consumption fell off contras seasonally in April after a record month in March. Lumber production has moved steadily upward; since the middle of April it has been in excess of orders after having lagged considerably behind the volume of new business during the first quarter. Operations in the paper manufacturing industry have contin-

ued around 90 percent of capacity since the end of 1936, the rate advancing to 92 percent in April and receding slightly in the following month. Bituminous coal production increased moderately during May after dropping sharply in April. The change in this industry was the major factor in the drop in the minerals production index for April.

Distribution of freight by the railroads has expanded during recent weeks by slightly less than the usual seasonal amount. Distribution of goods at retail declined moderately in April, after allowance for Easter and seasonal influences, but sales continue to reflect the favorable circumstance of rising purchasing power, and to some degree rising prices. Increases over a year ago in distribution series, as well as in manufacturing series, have tended to lessen during the second quarter since business was accelerating rapidly at this time last year and, in the retail field, the prospect of the prepayment of the adjusted service compensation certificates held by World War veterans was affording a special stimulus.

Increased output of manufacturers in April was accompanied by a further rise in factory employment and payrolls. Private building operations have continued to expand while Government work placed under contract has been at a lower rate this year than during the first half of 1936.

MONTHLY BUSINESS INDEXES

Graphic Comparison of Principal Data

Commodity Prices

THE sharp decline in wholesale prices of the more sensitive commodities which began the first of April continued for 6 consecutive weeks. From April 3 to May 15, the Bureau of Labor Statistics' weekly combined index declined 1.6 percent as a result of the 4.7 percent decline in the index of raw materials and the 3.3 percent drop in semimanufactures. Prices of finished products increased slightly, on the average, during this period although the movements of the commodity groups varied. Chemicals and drugs and metals and metal products were among the components showing substantial declines, while prices of hides and leather and fuel and lighting advanced somewhat.

Moody's daily index of spot prices of 15 commodities, which advanced 18 points (8.3 percent) in March, declined 20 points in April. After two periods of recovery in May—one of them exhibiting a rise of 7.7 points in the 6 days May 13–20—Moody's index closed the month with a continuation of the sharp decline which began the first week of April. With the exception of corn, the principal grains were especially weak the last of May. This recent series of sharp price fluctuations was paralleled and influenced by similar movements in Europe.

The general level of prices received by farmers in mid-May was somewhat lower than a month earlier,

according to the Bureau of Agricultural Economics, prices of wheat, cotton, cattle, lambs, eggs, and potatoes being lower and those of fruits, poultry, and dairy products being higher. However, prices of hogs at Chicago advanced at an unusual rate, 20 percent in the 15 days from May 5 to May 20.

The National Industrial Conference Board's cost of living index was 0.5 higher in April than in March and 5.9 percent higher than in April 1936. Indexes of all major component groups, except coal, advanced during the month. The index of retail food prices was only 0.2 percent higher in April than in March, but rents were 1.2 percent, clothing 0.4 percent, and sundries 0.2 percent higher.

Fairchild's index of retail prices of department store articles advanced for the tenth consecutive month, and was 0.7 percent higher on May 1 than a month earlier and 8.1 percent above May 1, 1936. Price indexes of all of the major groups advanced during the month, home furnishings continuing to record the greatest gains. Advances since the beginning of the year have been very marked in the cases of furs, blankets, sheets, floor coverings, furniture, men's clothing and shoes, infants' shoes, cotton wash goods, china, and luggage.

Domestic Trade

RETAIL trade throughout the country has continued during May to record improvement over a year ago, although the relative gains in most lines have not been so large as in the earlier months of the year and since March, the seasonally corrected indexes of trade have not advanced. Sales of general merchandise in rural areas during April were off slightly on a seasonally adjusted basis, as were the sales of variety stores, of chain grocery stores, and of automobile dealers. The index of department stores sales remained unchanged at the March figure of 93 (1923-25=100).

Aggregate wholesale sales of 1,186 firms reporting to the Bureau were about the same in April as in March but were substantially higher than a year ago. The major increases from March to April were in furniture and housefurnishings, lumber and building materials, and paints and varnishes. Compared with April a year ago, the increase in sales of these concerns on a weighted basis was about one-fifth, with better-than-average increases reported for electrical goods, furniture and housefurnishings, lumber and building materials, machinery, paints and varnishes, plumbing and heating equipment and supplies, hardware, and jewelry and optical goods.

Aggregate sales of more than 500 manufacturers reporting their dollar volume to the Bureau were slightly less in April than in March, with only a few lines reporting increases. The relative increase in comparison with the sales data for April 1936 approximated that reported by the wholesalers. The principal

increases were reported by the manufacturers of durable goods.

According to the data furnished by both the manufacturers and wholesalers for April, the ratio of collections to accounts receivable outstanding at the beginning of the month was higher than in April 1936, but lower than in March of this year, which had one more business day.

The importance of credit policies, and particularly the problems arising from the increase in installment sales, make the recently issued annual retail credit survey of the Bureau of major interest at this time. This report is based on data reported by nearly 2,000 stores, with sales approximating one and three-quarter billions of dollars in 1936.

While installment sales increased from 1935 to 1936 by a larger percentage than did sales for cash or on open credit, the data indicate that estimates based on less comprehensive surveys tended to overestimate the 1936 volume of sales on installment. The proportion of installment sales to total sales of the reporting stores increased from 12.8 to 14 percent. This percentage increased also in the 2 preceding years after dropping from 1930 to 1933, during which period sales of products normally sold in large volume on installment credit experienced a more-than-average decline. The bulletin, announcement of which is made on the back cover of this issue, has material which should be studied by all those interested in fluctuations in business activity.

³ End of month.

Employment

LABOR developments in April were featured by the continued expansion in employment and pay rolls, the validation of the National Labor Relations Act by the United States Supreme Court, settlement of the most important industrial disputes and the announcements of additional wage-rate increases. The gain in employment between mid-March and mid-April, while smaller than that recorded in either of the 2 preceding months, lifted the number at work in the manufacturing and nonmanufacturing industries surveyed regularly by the Bureau of Labor Statistics to a new high for the recovery period, except for December 1936.

In factories, the gain in the number of workers was more than seasonal, the adjusted index advancing about a point to 101.7 (1923-25=100). The expansion in employment was concentrated mainly in the durable goods industries, with the result that the difference between the number employed in the durable and non-durable groups (with relation to the base years) was further reduced. In April, employment in the former group was 1 percent below the 1923-25 average, while in the latter group it was 6 percent higher. A year ago, the two indexes were 18 and 4 percent lower, respectively, than in the base period.

The expansion in factory pay rolls in April was more marked than the rise in employment, with the result that average weekly earnings of all factory wage earners were higher than in March. Such earnings were still about 2 percent below the average for 1929, but in the

durable goods group, they were 2.7 percent higher than in 1929.

Fifty-eight of the eighty-nine manufacturing industries surveyed reported increased employment in April over March and 63 reported increased pay rolls. When adjustment for seasonal variation is made, the largest gains were in the machinery group and the chemicals and allied products group. Transportation equipment, iron and steel products, and nonferrous metals also reported more-than-average gains, with somewhat smaller increases reported for textile products, railroad repair shops, rubber products, and paper and printing. Declines in employment were reported for the stone, clay and glass products, food and products, leather and products, and tobacco manufacturing industries.

Bituminous coal mining was the only 1 of the 16 nonmanufacturing industries which reported a marked recession in the number at work in April, this change resulting from the decline in mining operations from the unusually high March rate. The largest relative gain reported for these industries was in anthracite mining and the second largest in private building construction.

Though a large number of wage-rate increases have been reported in recent months, the number of workers affected by such increases during the period extending from March 16 to April 15 was unusually large. According to incomplete reports received by the Bureau of Labor Statistics, at least 1,000,000 workers received wage-rate increases during this period.

¹Adjusted for seasonal variations.

Finance

MOVEMENTS of security prices during May have been irregular. The weakness in bond prices which was evident from mid-March to mid-April has been succeeded by a period of rather narrow fluctuations, slightly above the low point of the year. In the stock market, prices firmed in the early part of May and then broke rather sharply, the averages dropping to the low point of the year. Subsequently, the industrials made some recovery, but the utility shares remained weak. Railroad stocks have held up better than the other two groups in the March-May recession. Trading on the stock exchange has been relatively low during May, as it was in April.

New security issues have continued in reduced volume owing to the weakness in listed securities, although the firmer tone of the bond market permitted the successful flotation of one large issue. New security offerings recently have been less than a year ago, whereas during the first 2 months of the year the volume (exclusive of U. S. Government issues) was 60 percent in excess of the comparable 1935 total.

Part of the selling of bonds in March and April came from banks which needed to adjust their position to meet the last of a series of three increases in reserve requirements which became effective on May 1. As the banks had prepared for this over an extended period, the establishment of the higher requirements did not result in any significant developments in either the money or security markets. The Federal Reserve System reported an increase of \$39,657,000 in its holdings of government securities for the week ended April 28, making a total increase for the 4 weeks of April of

\$96,000,000; in the three following weeks reserve holdings of Government securities remained unchanged.

After the increased reserve requirements had been met the money market reflected a somewhat easier tone, and the open market rate on banker's acceptances of a maturity of 60 days and over was reduced by from one-sixteenth to one-eighth of 1 percent. This reduction, which followed a series of four consecutive advances earlier this year, was the first since October 1934.

As a result of the changes in the member bank reserve requirements effective May 1, the excess reserves of the member banks with the Federal Reserve Banks were reduced from \$1,640,000,000 on April 28 to \$890,000,000 on May 5. By May 19 they had risen again to \$910,000,000. When the second increase took effect, excess reserves were reduced from \$2,100,000,000 on February 24 to \$1,310,000,000 on March 3. The first increase in reserve requirements, effective August 15, 1936, had reduced excess reserves from \$3,170,000,000 on August 12 to \$1,810,000,000 on August 19.

The reporting member banks showed but moderate changes in their holdings of Government bonds and other security investments subsequent to May 5. Previously they had liquidated a considerable volume of investments, the holdings of all securities having been reduced \$200,000,000 in the period from March 31 to May 5. Actually, of course, the reduction in Government securities held had extended over a period dating from the middle of 1936.

Gold in the Treasury "inactive" account as of May 29 amounted to \$757,900,000, an increase of \$190,000,000 as compared with the amount held on May 1. In the preceding month, the increase amounted to \$225,000,000.

Foreign Trade

EXPORT trade during April, on a seasonally adjusted basis, was at the highest level since the third quarter of 1930. Imports which had been exceptionally large in February and March, fell 4 percent in April, after seasonal adjustment. In comparison with April of last year, the relative increases in the value of exports and imports were approximately the same—about 40 percent.

A part of the increase in value of both exports and imports over April 1936 was the result of price advances. The export unit value was 8 percent higher in April than a year ago and that of imports was 13 percent higher. In terms of quantity the increase over April 1936 in exports of United States merchandise was 30 percent and in imports for consumption 25 percent.

As in other recent months the increase in both quantity and value of exports over the corresponding month of 1936 was mainly in semifinished and finished manufactures and nonagricultural crude materials. These items combined, which made up over four-fifths of the total exports, increased 47 percent in value. Exports of iron and steel manufactures, copper, lubricating oil, coal, motor trucks, and agricultural machinery (mainly tractors) increased relatively more in value than did the combined group; exports of industrial machinery increased approximately as much (46 percent); while exports of passenger automobiles, electrical apparatus, cotton manufactures, and paper manufactures increased from 30 to 40 percent.

The value of agricultural exports, although still relatively low, was about 15 percent higher in April than in the same month of 1936. Certain products, namely, raw cotton, wheat flour, canned and dried fruits, were larger in both quantity and value than last year, while tobacco exports were lower.

The increase in the value of exports from March to April resulted primarily from larger shipments abroad of coal, petroleum and products, iron and steel manufactures, machinery, electrical apparatus, and motor vehicles. Exports of foodstuffs, raw cotton, tobacco, and lumber declined.

The decline in the April import value from that of March was caused mainly by smaller importations of coffee, flaxseed, corn, hides and skins, unmanufactured wool, wood pulp, and tin, although the figures also recorded somewhat smaller imports of many other commodities.

In comparison with April of last year, imports of all economic classes increased substantially in value in April 1937. Agricultural commodities made up 56 percent and nonagricultural commodities 44 percent of the total import value in both April 1936 and in April 1937. Price advances accounted for a considerable part of the rise in value of the crude material, semi-manufactured, and foodstuff classes. Quantity increases for each of these classes of imports was relatively smaller than the increase in imports of finished manufactures.

¹ Adjusted for seasonal variations.² General imports through December 1933; imports for consumption thereafter.³ Monthly average.

Real Estate and Construction

RESIDENTIAL building contracts awarded during April were substantially larger than in March. For this type of building, contract awards in the 37 States covered by the F. W. Dodge service were valued at \$108,013,000, about 60 percent more than a year ago and the largest total for any month since May 1930. On a daily average basis these awards were about one-fourth larger in value than in March, a more-than-seasonal increase. Other types of construction contract awards also recorded improvement in April, total awards being valued at \$269,934,000, an increase over March, on a daily average basis, of one-fifth. The usual seasonal gain for this period is about 15 percent.

Comparisons with a year ago are more favorable for residential construction than for other major classifications of building. For all groups, however, the relative increases in April were smaller than those recorded during the first quarter, partly because weather conditions were more favorable to initiating projects this year than in early 1936. Thus, the 60 percent gain in the value of residential building awards in April over a year ago compared with an increase of nearly 90 percent in the first quarter. Nonresidential contracts in April were only 2 percent larger in value than a year ago as compared with a 7 percent gain in the first quarter over last year. Public utility contracts were valued at a smaller amount in April than a year ago, but for the first quarter they were up more than 50 percent.

Publicly owned projects, which have accounted for a large proportion of the construction contracts awarded in recent years, continued to diminish in importance during April. In that month, publicly owned awards accounted for only about one-fourth of the total contracts as compared with 38 percent in the first quarter of the year and 63 percent during the full year 1934.

The continued upward movement of building costs appears to be a retarding factor in some areas. The Bureau of Labor Statistics' index of building material prices has advanced to 96.9 percent of the 1926 average, a gain of 7 percent since the early part of January and an increase of 13 percent since last May. Reflecting the effects of these increases on building costs and rising labor costs as well, the Home Loan Bank Board's indexes of small-house building costs for 26 widely separated cities showed gains ranging from 2 to 16 percent over the period extending from January to April.

With the improvement in the building and other wood consuming industries this year, the Lumber Survey Committee of the United States Department of Commerce has estimated that consumption of lumber during the first half of 1937 will exceed that of the corresponding period last year by 16 percent. Production has been below consumption during most of the past 5 months, with the result that stocks have declined. This has been due partly to the long tie-up of West Coast shipping, when producers were unable to get lumber to the markets, and more recently to a shortage of cargo space.

National Income Gain in 1936 Largest of Recovery Period

By Robert R. Nathan, Chief, National Income Section, Division of Economic Research

NATIONAL income produced increased from 55 billion dollars in 1935 to 63.8 billion dollars in 1936, thus continuing the upward trend which was initiated in 1933. This represents the largest increase for any year of the recovery period. The net value of goods and services produced in the United States in 1936 was nearly 9 billion dollars more than the revised estimate for 1935, and nearly 25 billion dollars, or 61 percent above the low point of the depression recorded in 1932. Since prices were but slightly higher in 1936 than in 1935, nearly all of the increase in dollar volume last year represented an increase in "real" income. The dollar total for 1936 was approximately one-fifth lower than the total for 1929. Each of the major industrial divisions contributed to the enlarged output in 1936 with manufacturing, trade, and agriculture accounting for more than half of the total gain.

National income paid out in the form of wages, salaries, dividends, interest, entrepreneurial withdrawals and other items increased from 54.6 billion dollars in 1935 to 62.1 billion dollars in 1936. These figures compare with the 1929 total of 78.2 billion dollars and the 1933 low of 44.9 billion dollars. Of the 7.4 billion increase over 1935, nearly 5 billion was accounted for by the increase in the compensation of employees and another 1.5 billion represented increased dividend disbursements, the latter being approximately half again as large in 1936 as in 1935.

Employees compensation in 1936 represented a fractionally higher proportion of the national income paid out than in 1935, and was above the percentage shown for any year covered by the study. The proportion which dividends represent of total income payments increased sharply in 1936. Interest payments continued the decline in relative importance which began in 1934. Generally, the 1936 changes tended to bring the various types of payments more closely in line with their 1929 relationships.

Preliminary estimates indicate that income produced exceeded income paid out in 1936. In each of the years 1930 to 1934, inclusive, income paid out exceeded income produced, resulting in negative business savings which reached substantial proportions in the years of severest depression. While the estimates of business savings in 1935 and 1936 are not only preliminary but also are subject to numerous qualifications, the elimination of the large negative business savings which had reached the magnitude of nearly 9 billion dollars in 1932, is a development of considerable interest.

Basis of Estimates.

Comprehensive discussions of the concepts, scope, and limitations underlying these estimates have appeared in previous publications of the Department of Commerce.¹ While the basic concepts and scope of the estimates shown in the accompanying tables have not been altered materially from those followed in the previous estimates, many of the sources and methods

Figure 1.—Income Produced, by Major Industrial Classes, 1929-36.

have been changed since the release of the publication, "National Income in the United States, 1929-35." Limited space permits only a brief resumé of the definitions and of the changes in sources and methods which have led to revisions in the estimates.

In a study of this nature which entails the application of a great variety of statistical data derived from many agencies, it is both necessary and desirable to revise and to improve the estimates as the opportunities to do so present themselves. The degree of accuracy

¹ Since the Department of Commerce initiated work in this field several years ago in response to a Senate resolution, it has published two volumes entitled "National Income, 1929-32", S. Doc. 124, 73d Cong., 2d sess., published in 1934 (out of print) and "National Income in the United States, 1929-35", published in 1936. Articles containing summary estimates have appeared in the January 1935, August 1935, November 1935, and the July 1936 issues of the Survey of Current Business. Each of the two volumes mentioned above included detailed descriptions of the sources and methods used in deriving the figures as well as explanations of the concepts, scope, and limitations of the estimates.

of the estimates differs considerably from industry to industry and only by continued investigation can the weaker series be improved. Although the tendency to revise the estimates whenever improvements can be made may lead to some inconvenience on the part of those using the estimates, such a procedure is necessary for accuracy.

Comparison of the present estimates with those appearing in "National Income in the United States, 1929-35" will reveal minor revisions for all years from 1929 through 1933, and important revisions for 1934 and 1935 in many industrial divisions and for most types of income payments. These changes resulted from the use of new data made available since the above volume was completed, and from improved methods of estimation developed by more intensive investigation in various directions.

¹ The grand totals in this and the following tables are obtained by an addition of the totals for each industrial field. The income subtotals by industrial fields are primarily in thousands of dollars, while the subtotals of gainfully engaged are usually in actual numbers. The subtotals entered in tables 1 to 4 are either in millions of dollars (for income) or in thousands of persons (for numbers engaged). These subtotals do not, therefore, add up exactly to the grand totals given.

Definition of Terms.

The net value of all commodities produced and services rendered in the Nation in a given year is termed

the "national income produced." Theoretically, this total represents the gross value of all goods and services produced, minus the value of raw materials and capital equipment consumed in the productive process. Individuals contribute their services toward the production of these goods and services in the form of personal effort or through furnishing capital, and for these contributions they receive wages, salaries, interest, dividends, entrepreneurial withdrawals, and net rents and royalties. The aggregate of these payments is designated "national income paid out."

In some years the income produced exceeds the income paid out and the business enterprises² of the Nation retain this residual portion of the net product which is called "positive business savings." In other years income disbursed is larger than income produced, and the business enterprises draw upon their resources, this difference being termed "negative business savings."

Positive or negative business savings should not be confused with business profits or losses as commonly used since the former represents the residual after deductions for dividends and entrepreneurial withdrawals; whereas, the latter is usually represented as the amount available for dividend distribution or for withdrawals by entrepreneurs. While positive and negative business savings may be defined precisely for theoretical purposes, they are particularly difficult to measure, not only because of the lack of data, but also because available business records are not entirely suitable for measuring certain phenomena strictly in accord with economic concepts. Estimates of business savings of unincorporated enterprises are based upon questionable assumptions because of the almost complete absence of data relative to the income of such enterprises. Estimates of business savings of corporations are more reliable because of the availability of data from income tax returns, but even here the figures are affected by methods of valuing inventories and by the extent to which depreciation allowances vary from the actual value of capital equipment consumed in the productive process during the given year. When business enterprises follow the practice of valuing inventories at cost or replacement, whichever is lower, negative business savings are exaggerated during periods of falling prices merely because of this price factor. Because of these limitations, estimates of business savings must be interpreted with caution and without attaching too much significance to their magnitude.

Except for agriculture, income paid out is estimated directly. Income produced is arrived at by adding positive business savings to, or deducting negative

² In this study, all industrial and independent occupational units engaged in the creation or distribution of commodities or services are regarded as "business enterprises." Included in this category are not only business corporations and partnerships but also individually owned business establishments, governmental agencies, farms, trade associations, and independent professional practices. The farm or physician's practice are business enterprises, whereas the farmer and the physician are entrepreneurs and the compensation they receive for their services is termed "entrepreneurial withdrawals."

business savings from, income paid out. Thus it is evident that estimates of income produced are subject not only to the limitations of the estimates of income paid out, but also to those of business savings. For agriculture, available information permits a direct estimate of income produced, but the problem of estimating the amount paid out by this industry is a particularly difficult one and involves the use of very broad assumptions.

Revisions in Estimates 1929-35.

Particularly influential in causing revisions in the 1934 and 1935 estimates were the data provided by the various censuses of 1935 and the figures derived from tabulations of the 1934 income-tax returns, which will appear in the *Statistics of Income* for 1934, to be published by the United States Bureau of Internal Revenue. The latter publication appears annually and is made available about 2 years after the close of the year to which the data apply. Thus, the property income estimates, which are based largely on these data are always subject to revisions for the most recent years. In this article, the estimates of property income and business savings for 1935 and 1936 are based on an analysis of a large number of published corporation income statements and balance sheets, and the figures will be revised in accordance with the *Statistics of Income* volumes for 1935 and 1936, when they are made available. Estimates of business savings based upon a sample of published corporation reports are subject to substantial error for periods when negative business savings are being eliminated and positive business savings are appearing for so many business enterprises. It is difficult to use the percentage changes derived for the corporate sample because the positive and negative amounts tend to be small and often the savings in the base year may be positive for the sample corporations and negative for all corporations or vice versa. The sample which was used for indicating changes between 1935 and 1936 included published reports for more than 2,200 corporations.

Results of the 1935 Census of Manufactures and the Trade, Service, and Mining sections of the 1935 Census of Business led to sizable upward revisions in both the 1934 and 1935 estimates of employment and pay rolls for these industries. The previous estimates had been based on earlier census results extended by the use of current pay roll and employment indexes. There is definite evidence that these indexes had a downward bias during the recovery period. In addition to showing bias in the extent of change from earlier censuses, the 1935 Census of Business covered several new branches of the service industry. Many of these activities had not been recovered in the earlier income figures, and estimates for them have now been included for all years covered by this study.

Upward revisions were offset in part by changes in the estimates for some branches of government, insur-

ance, and transportation. In these instances the changes resulted from the availability of new basic data or from the refinement of available data as a result of more intensive analyses. The revisions will be described more fully in a bulletin to be issued by the Department of Commerce in the near future.

The 1935 and 1936 estimates of property income and business savings are preliminary pending the tabulations of income-tax returns for these years. In addition, the industrial classification of property income and corporate savings will be changed for all years as soon as additional tabulations are made of the 1933 and 1934 income-tax returns. Changes in revenue acts led to the elimination of consolidated returns in 1934 and subsequent years for all except railroad corporations. Many subsidiary corporations, whose records had been included in the parent company's consolidated statement and in the industrial classification of the parent company, were required to submit separate (unconsolidated) returns in 1934 and thereafter. It is obvious that the industrial classification of corporation activities has been affected considerably by this change in the revenue laws. For the purpose of the estimates included herein, the figures for 1934 were adjusted, as adequately as data permitted, in order to conform to the earlier figures on the consolidated basis. More detailed tabulations of the returns for those corporations which submitted consolidated returns in 1933 and unconsolidated returns in 1934 are being prepared by the Bureau of Internal Revenue for the Department of Commerce. These tables will serve as a basis for reclassifying the figures for earlier years in accordance with the industrial classification of the unconsolidated returns.

Estimates of net rents and royalties appearing in the accompanying tables, as well as those included in earlier publications, are not wholly satisfactory because of the omission of rents originating in several industries. An investigation of these omissions and the preparation of estimates to complete the series is now in progress. The increase in net rents likely to result from this analysis probably will be offset by a decline in the estimates of interest payments when a further investigation of this item has been completed. In preparing estimates of interest payments to individuals, it is necessary to eliminate interbusiness payments. This has been accomplished by assuming that all short-term interest is paid to banks and other business enterprises and that interest receipts on long-term holdings of business units are confined to interest received on Government securities. The latter assumption has been accepted because of the limited nature of available data. Additional information bearing on this subject is being developed and a study of this problem will enlarge the deductions for interest paid to business units and thus reduce the estimates of interest payments to individuals.

Income Produced and Income Paid Out.

The totals of income produced and income paid out as shown in tables 1 and 2 indicate the marked improvement in 1936, as well as the substantial recovery which has occurred during the past 3 or 4 years. More than one-third of the 25-billion-dollar increase in the annual income produced from 1932 to 1936 occurred in 1936. Approximately 60 percent of the decline from 1929 to 1932 had been recovered by 1936, bringing the level in the latter year to within about one-fifth of the 1929 total of 80.8 billion dollars. The 7.4 billion dollar rise in income payments in 1936 was more than twice as large as the gain of the preceding year. Income paid out in 1936 was 17.1 billion dollars higher than in 1933, the low year of the depression for this series; this increase represented more than half of the decline from 1929 to 1933.

Comparisons between income produced and income paid out for each year reveal positive business savings in 1929 of 2.6 billion dollars, followed by increasingly large negative business savings through 1932 when this item totaled nearly 9 billion dollars. Income produced and income paid out practically balanced in 1935, and the preliminary estimates point to positive business savings of about one and three-quarter billion dollars in 1936. As discussed in the preceding section, the limitations attaching to these estimates are such that

not too much importance should be assigned to their absolute size in any particular year.

An analysis of the estimates of business savings by industrial classes indicates positive business savings of 1.9 billion dollars in agriculture in 1936. If agriculture is excluded, all other industries combined show slight negative business savings. The estimates of business savings for agriculture are unsatisfactory because they are influenced materially by the assumption that the average withdrawals of farmers are equal to the average wages paid to hired labor. As a result of this assumption, the estimates tend to show much wider fluctuations in business savings for agriculture than actually occur. These estimates will be improved measurably when adequate data are available on depreciation charges, capital outlays, and changes in real inventories.³ The differences between the latter two items and the former

**Figure 2.—Percentages Changes In Income Produced By Industries From 1929 To Depression Low And From 1929 To 1936.**

(Black area represents proportion of decline recovered since low year)

item would reflect much more accurately the extent of positive or negative savings for agriculture than do the differences between the directly estimated income available to farm operators and the withdrawals of farm operators estimated on the basis of the above assumption.

Real Income Rose Substantially in 1936.

Both the cost-of-living and wholesale price indexes of the United States Bureau of Labor Statistics increased only slightly more than 1 percent in 1936 over 1935. Neither of these series is suitable for converting the dollar income estimates to a physical volume basis, but they do provide some indication of the general influence of price changes. Thus, it is evident that the 16 percent increase in income produced and the 14 percent increase in income paid out in 1936 reflect a substantially higher physical volume of commodities and services produced and a much enlarged real purchasing power of individuals. Since 1932 income produced has increased more than 60 percent and wholesale prices

³ The Bureau of Agricultural Economics of the United States Department of Agriculture is now engaged in developing data on these items.

have risen approximately 25 percent. Similarly, income paid out was 38 percent higher in 1936 than in 1933, while the Bureau of Labor Statistics index of the cost of living of urban wage earners increased about 8 percent over the same interval. During the period of decline the percentage decrease in income was much larger than the percentage decline in prices.

¹ Includes mining, manufacturing, construction, steam railroads, Pullman, railway express, and water transportation.

² Includes pay rolls and maintenance of Civilian Conservation Corps enrollees and pay rolls of Civil Works Administration, Federal Emergency Relief Administration, and the Federal Works Program projects plus administrative pay rolls outside of Washington, D. C., for all except the Federal Works Program. Area office employees and their pay rolls under the Federal Works Program are included with the regular Government employment and pay-roll figures.

³ Includes also net balance of international flow of property incomes.

Practically all indexes of the quantity of goods produced or services performed show marked gains since the low point of the depression. In some series, the 1936 average levels were not far below those of 1929. However, in the construction, mining, and steam railroad industry the volume of activity in 1936 was far below the level which prevailed immediately preceding the depression. The national income produced and the Bureau of Labor Statistics wholesale price index in 1936 were 21 percent and 15 percent, respectively, below their 1929 levels. Probably a more comprehensive price series reflecting properly the price of all goods and services produced would indicate a greater disparity between the real income in 1936 and in 1929 than is indicated by the Bureau of Labor Statistics wholesale price index. Moreover, in making any com-

parisons between recent years and 1929, it is important to keep in mind the continued growth in population.

All Industrial Groups Share in 1936 Rise.

Each of the 12 major industrial groups into which the economic activities of the Nation have been classified showed gains in 1936 in both income produced and income paid out. The construction, manufacturing, and mining groups all recorded increases of more than 20 percent in income produced in 1936 relative to 1935. Income produced in manufacturing, mining, and agriculture more than doubled from 1932 to 1936. Despite the 32 percent gain in 1936 in the construction industry, the total was only one-third as large as in

Figure 3.—Income Paid Out, By Type Of Payment, 1929-36.

1929. The mining, transportation, and miscellaneous industries still remained more than 30 percent below 1929. Agriculture accounted for a larger percentage of the national income produced in 1936 than in any other year covered by the study. The proportion of the national product attributable to manufacturing declined from 24 percent in 1929 to 14 percent in 1932 and then increased to 23 percent in 1936. As shown in chart 1, the commodity producing industries declined more than did other groups, and they have also shown the largest percentage gains during the recovery period.

The largest percentage increases in income payments in 1936 relative to 1935 occurred in the construction, manufacturing, mining, and Government groups.⁴ Ap-

⁴ It is not possible to estimate business savings for Government service and therefore it has been assumed that income produced is equal to income paid out in this branch of our economy. A discussion of the theoretical and practical aspects of measuring income for Government service appeared in "National Income in the United States 1929-35," p. 185-187.

proximately two-thirds of the 1.2 billion dollar increase in income disbursed by Government agencies represented increased aggregate work relief wages. Recipients of income from manufacturing received over 5 billion dollars or two-thirds more in 1936 than in 1932. Relative to 1929, income paid out in 1936 varied from 143 percent for Government and 91 percent for the electric light and power and manufactured gas industry to 36 percent for the construction industry.

Dividends Double from 1933 to 1936.

All major types of income payments except interest increased in 1936. Preliminary indications point to a slight drop in the amount of interest flowing to individuals. Compensation of employees increased from 1935 to 1936 in the same proportion as did total income paid out, 14 percent. Dividends in 1936 are estimated to have been 1.5 billion dollars, or approximately 50 percent, higher than in the preceding year and more than double the total for 1933. Despite this sharp rise, dividends disbursed to individuals were 23 percent lower in 1936 than in 1929. Total labor income was 19 percent lower in 1936 than in 1929. In those industries in which salaries and wages could be segregated, the increase in wages during the recovery period has been greater than the rise in salaries, thus reducing substantially the disparity which resulted from the much greater decline in wages than in salaries from 1929 to 1932.

Work relief wages include the compensation of employees engaged on projects under the various public work relief programs in 1933 and subsequent years. Data on this item for years prior to 1933 are not available. The large increase last year resulted from the fact that this period represented the first full year's operation of the Federal Works Program. The Works Program, which was begun in the middle of 1935, replaced the Federal participation in emergency unemployment relief, administered cooperatively by the Federal Emergency Relief Administration and the various States. Under this program, employable cases are certified by local public relief agencies as eligible for Works Program employment. Pay scales are based upon predetermined wage schedules rather than upon budgetary deficiencies, as was the practice under the Federal Emergency Relief Administration work projects. Average earnings under the Works Program are larger than under the preceding program. A larger proportion of total relief recipients were receiving work relief in 1936 than in 1935. Generally, average work relief wages are much larger than average direct relief grants, and since direct relief grants are not included in the income estimates, this was another factor affecting higher total work relief wages in 1936.

Work relief wages are included in the income estimates, just the same as other wage payments, on the presumption that they represent compensation for

economic services rendered. Direct relief disbursements are not included in the national income estimates since they are held to be income transfers rather than income payments. There was a decline from 1935 to 1936 of about 400 million dollars in direct relief. Another item which had a direct and significant influence upon purchasing power in 1936, which is not regarded as a current income payment, was the soldiers' bonus. In 1936 approximately 1.9 billion dollars was distributed in cash and in bonds to war veterans.

Employee's Share of Income at New High in 1936.

As shown in table 4, employees' compensation represented a slightly higher proportion of the national income paid out in 1936 than in 1935. Labor's share of 66.5 percent in 1936 compares with 65.5 percent in 1929 and the low of 64 percent in 1932. The percentage which dividends represent of the total income disbursed increased from 5.6 percent in 1935 to 7.4 percent in 1936, which is only slightly below the proportion for 1929. Interest payments, which represent the most inelastic type of income payment, declined as a proportion of total income payments from 10.3 percent in 1933 to 7 percent in 1936. This type of payment had increased from 6.5 percent of the total national income paid out in 1929 to 10.3 percent in 1933. Work relief wages accounted for 3.3 percent of total income payments in 1936 as compared with 2.3 percent in 1935.

² Includes also net balance of international flow of property incomes.

Employment and Per Capita Incomes.

Table 5 includes annual estimates of the number of employees and of their per capita income. Wherever possible, the number of employees has been converted to full-time equivalency so as to make for greater comparability in the per capita income figures from industry to industry and from year to year. However, available data did not permit conversion to the same degree of accuracy in all industries, and the estimates are subject to limitations on this account. The

employment estimates exclude unpaid family labor in agriculture and also those employed on work relief projects.

Table 5.—Number of Employees and the Per Capita Income of Employees¹
[1931 figures are omitted because of space limitations]

Bureau of Labor Statistics cost-of-living index.....	100.0	97.5	80.2	76.2	79.0	81.1	82.1

¹ The estimates of the number employed are averages for the year and represent full time equivalent numbers for industries in which data permit such adjustments.

² Does not include employers and self-employed persons, such as farmers, merchants independent professional practitioners, etc., nor work relief employees and unpaid family farm labor.

³ Includes mining, manufacturing, construction, steam-railroads, Pullman, railway express, and water transportation.

The number of persons employed declined 26 percent from 1929 to 1933 and then recovered to within 12 percent of the 1929 level in 1936. For those industries in which salaried workers and wage earners can be segregated, the decline from 1929 to 1932 was 27 percent

for salaried workers and 40 percent for wage earners. This disparity was entirely eliminated during the period of recovery.

Per capita incomes are derived by dividing salaries and wages by the full time equivalent number of employees, thus representing the average annual pay rate of full-time employees. The average income of all employees, excluding work relief employees and unpaid family farm workers, dropped 25 percent from 1929 to 1933 and increased 15 percent from 1933 to 1936. Although the Bureau of Labor Statistics cost-of-living index is not representative of changes in the living costs of all workers, it may be used to indicate roughly changes in the per capita real income of employed workers in recent years. In 1933 this cost-of-living index was 24 percent lower than in 1929 as compared with the 25 percent drop in the per capita income. In 1936 the average dollar income of all employees was 14 percent less than in 1929, and the cost of living was 18 percent lower. These comparisons indicate, generally, that per capita real incomes of those employed full time were fairly well maintained throughout the depression although, of course, there were marked variations between different occupations and different industries. The data show much more pronounced cyclical variations in average wages than in average salaries.

Only a limited number of copies of the volume, "National Income in the United States, 1929-35," are available for sale, and a similar volume will not be published until 1938. The Department of Commerce, however, plans to issue a bulletin in the near future which will contain a more comprehensive discussion of the theoretical aspects of the subject and more detailed explanations of changes in sources and methods than have been included in this article. Estimates will be given in the same detail as in the tables appearing in chapters III and IV of "National Income in the United States, 1929-35", showing numbers of persons engaged, income produced, income paid out, types of income payments, and per capita incomes for each of the 12 major industrial divisions. The bulletin will be available for distribution about August 1, and an announcement of the publication date will appear in the Survey of Current Business.

Farm Equipment Sales Continue to Expand¹

PRODUCTION and sales of farm equipment continued to expand during 1936 and so far in 1937, with current output comparing favorably with the average of the predepression years. Figures recently released by the Bureau of the Census reveal a rise of 46 percent in production and of 37 percent in total sales in 1936 over the comparable figures for 1935 and, while comparable data are not available for recent months, the employment data and other information which has been published indicate that a further marked improvement has occurred during the current year. Value of production during 1936 exceeded the combined value of domestic and export sales by 9 percent, according to the Census data.

Sales Follow Fluctuations in Farm Income.

The farmer's ability to buy equipment is, of course, to a major degree dependent upon his income, and the improvement in his potential demand is clearly demonstrated by the data presented in figure 2. Reflecting increased production of livestock and livestock products, higher farm prices, Government payments under the Agricultural Adjustment and the Soil Conservation Acts, and relatively stable production expenses, the amount of cash income available to the operator for his labor, capital, and management recorded its fourth successive increase in 1936. This 1936 net income was the largest in recent years.

It is evident from figure 2 that sales of farm equip-

ment have followed rather closely the trend of income in recent years, despite the marked year-to-year changes in the latter.² Monthly data on production and sales of farm equipment are not available, but on the basis of the close correspondence between the movements of sales of farm equipment and cash income available to the farmer for his labor, capital, and management, the 16 percent gain in total cash income³ during the first 4 months of 1937 over the corresponding period of 1936 suggests a continuation of the upward trend in the volume of farm equipment business.

Further evidence of this trend is afforded by the data on employment and pay rolls in agricultural implement manufacturing plants which are reported monthly by the Bureau of Labor Statistics. In April of this year, both employment and pay rolls were at the highest levels of the recovery period. As shown in figure 1, the annual changes in these two series follow closely the variations in farm equipment manufacturing. Also indicative of the current trend is the recent report that billings of the company which handles a considerable part of the farm equipment business were about 30 percent larger for the 6 months ended April 30 than in the corresponding period of the preceding fiscal year.

Other basic factors influencing the upward movement in farm implement business are: (1) the obsolete

¹ This article was assembled by Jay A. Van Swearingen, of the Division of Economic Research, from material of the Bureau of the Census and the Bureau of Foreign and Domestic Commerce.

² Refers to cash income available to the farmer for his labor, capital, and management and represents gross income less all production expenses and the value of products used in the farm home. This series and the one mentioned in footnote 3 are compiled by the Bureau of Agricultural Economics, U. S. Department of Agriculture.

³ Cash income in this instance relates to the value of quantities sold, excluding products used in the farm home.

Figure 1.—Value of Farm Equipment and Related Products Manufactured Compared with Employment and Pay Rolls in the Agricultural Implement Industry. (U. S. Departments of Commerce and Labor.)

condition of an undetermined part of the existing farm equipment which has resulted from the curtailment of necessary replacements during the depression years; (2) the development of new types of machines which contribute to the efficiency and economy of farm operation; and (3) the increased demand from abroad since 1932.

Production in 1936 Only 4 Percent Below 1930.

Farm equipment manufactured in 1936 had a value of \$487,273,000, and domestic sales amounted to \$409,090,000, according to preliminary data compiled by the Bureau of the Census. Production was only 4 percent below the 1930 figure of \$507,002,000 and 20 percent below that of 1929, which was the best year on record. The 1936 figure was about four times the estimated value of the production for 1932.

The fourfold classification of farm equipment manufacture shown in figure 3 represents combinations of the items given in the more detailed statement issued by the Bureau of the Census. This condensed classification affords a means of showing the changes from year to year in each major group, and indicates the relative importance of each group.

Tillage equipment includes plows, harrows, cultivators, planting and seeding machinery, and in general those machines which are used to prepare the soil and to plant and care for the growing crop up to the time of harvest. The second group, harvesting machinery, is made up of grain binders, corn binders, reapers, combined harvester-threshers, threshing machines, and in general all equipment used in harvesting the crop and preparing it for market.

The third and most important class from the standpoint of value of product, is the tractor group which

comprises all types of tractors and parts. The fourth class, miscellaneous farm equipment, includes a wide variety of machinery and appliances not used directly in the produc-

Figure 2.—Domestic Sales of Farm Equipment and Related Products Compared with Cash Income Available to the Farmer for His Labor, Capital, and Management. (U. S. Departments of Commerce and Agriculture.)

tion of crops but which are important on every farm, such as barn, dairy, and poultry equipment, and windmills.

Tractors Most Important Product.

Figure 3 depicts the trend of production from 1920 through 1936, omitting a breakdown for the years 1932–34 for which comparable figures are not available. The relative importance of the four classes changed very little in 1936 as compared with 1935, although the chart brings out the major shifts that have occurred over the past 17 years. The tractor group continued as the most important of the four major classes, output being valued at \$214,854,000, or more than 40 percent of the value of all farm equipment produced. The gain from 1935 to 1936 in the value of tractors and parts produced amounted to 45 percent. Tillage, planting,

Figure 3.—Value of Production of Farm Equipment and Related Products (Bureau of the Census, U. S. Department of Commerce).

NOTE.—The Census of production of farm equipment and related products was not taken for the years 1932 to 1934, inclusive. The totals for these years are unofficial estimates.

and cultivating machinery recorded a gain of 46 percent, while the value of harvesting machinery increased 54 percent and of miscellaneous equipment, 40 percent.

The accompanying table gives comparative figures on production and sales of the principal classes of farm equipment and related products for the years 1930, 1931, 1935, and 1936. For both 1935 and 1936, the figures indicate an increase in manufacturer's stocks in practically all major lines. In the spring of 1936, however, most manufacturers experienced considerable difficulty in meeting the heavy demand, and it was not until later in the year that stocks were built up.

Export Trade Increased.

Exports of farm equipment and related products recorded marked improvement in 1936. With relation

Figure 4.—Exports of Farm Equipment and Related Products and the Percentage of the Production of These Products Exported (Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce).

to 1929, however, foreign sales are still much lower than domestic sales. Thus, while exports in 1936 totaled \$43,993,899, according to data compiled by the Bureau of Foreign and Domestic Commerce, a gain of 37 percent over 1935, they were less than one-third as large as in 1929. Domestic sales, on the other hand, were more than three-fourths as large as the 1929 total.

Exports were valued at about 9 percent of 1936 output as compared with nearly 10 percent in 1935 and 27 percent in 1931, when the Union of Soviet Socialist Republics was buying heavily in this country. Shipments to Canada, which continued as the largest buyer of United States farm equipment, recorded a gain of 53 percent in 1936 as compared with 1935, reflecting in part improved farm purchasing power in that country, the removal of tariff duties on tractors and the lowering of duties on other farm machinery. Australia moved from third place in 1935 to second place last year, while Iran, a comparatively small buyer, moved from 37th place to 20th place, mainly as a result of heavy tractor purchases. The Soviet Union, which was the third largest buyer in 1929, had dropped to 54th place by 1936, equipment needs in that country now being met largely by their own plants.

Tractors have continued as the most important single item in foreign as in domestic sales. Sales of tractors and parts abroad in 1936 recorded a gain of 55 percent over the preceding year and accounted for 65 percent of the value of all exports of farm equipment. An important factor in the expansion of tractor exports has been the development of the all-purpose type tractor and the fuel injection type (Diesel and semi-Diesel); due to economy of operation, the latter is becoming increasingly popular in countries having high gasoline prices.

Exports for the first quarter of 1937 were 63 percent over the corresponding period of 1936. They were the largest for this period since 1931 but less than 40 percent of those for the earlier period.

Table 1.—Value of Farm Equipment and Related Products Manufactured and Sold, by Classes: 1936, 1935, 1931, and 1930

[The sales statistics refer only to sales by manufacturers and do not cover sales by dealers to consumers. The principal difference between the export sales as reported by manufacturers and the value of exports as reported by the Bureau of Foreign and Domestic Commerce is the fact that many manufacturers report to the Bureau of the Census on a fiscal-year basis, whereas the reports of the Bureau of Foreign and Domestic Commerce are compiled on a calendar-year basis. The figures for export sales understate somewhat and those for domestic sales correspondingly overstate the amounts of the actual sales, because of the fact that some manufacturers sell to middlemen who export a part but not all of the commodities they purchase, so that manufacturers do not in all cases know whether their products are destined for export. The value figures include values of attachments and parts.]

Class	Year	Manufactured	Sold by manufacturers—

Monthly Business Statistics

The following table represents a continuation of the statistical series published in the 1936 Supplement to the Survey of Current Business. That volume contains monthly data for the years 1932 to 1935, inclusive, and monthly averages for earlier years back to 1913 insofar as available; it also provides information as to the sources of the data and sufficient descriptive material for a proper interpretation of each series. These notes also indicate the source from which monthly figures prior to 1932 may be obtained. It is essential that all users of the SURVEY have this base book which may be secured from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 35 cents per copy.

A few series have been added or revised since the 1936 Supplement went to press. These are indicated by an asterisk (*) for the added series and by a dagger (†) for the revised series. A brief footnote accompanying each of these series provides a reference to the source where the descriptive note may be found.

The terms "unadjusted" and "adjusted" used to designate index numbers refer to the adjustment for seasonal variation. Data subsequent to April will be found in the Weekly Supplement to the SURVEY.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey.	1937	1936										1937

* Revised.

* New series. Data on number of grade crossing projects represent a breakdown of the total projects shown in the 1936 Supplement. For the foreclosures indexes, earlier data, together with a complete description of the indexes, see table 18, p. 20 of the April 1937 issue. Total mortgage loans outstanding of Federal Savings and Loan Associations represent the combination of loans of "new associations" and "converted associations" which were shown separately in the 1936 Supplement to the Survey. The Home Owners' Loan Corporation data are for loans closed through June 12, 1936, when lending operations ceased, and for loans outstanding thereafter. The June 1936 figure represents the total of all loans made during the full period of lending operations.

Index as of May 1, 1937, is 232.7.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

* Receipts for Louisville not included.
 * Revised.
 * New series. Data on radio and magazine advertising cost are compiled by the *Publishers Information Bureau, Inc.*, successors to *National Advertising Records*, and are not comparable with data published prior to those shown in the January 1937 issue. Earlier figures, when available, will be published in a subsequent issue.
 * Grocery chain-store sales indexes in continuation of those shown on p. 14 of the May 1937 Survey are: Unadjusted, February revised 97.8, March revised 100.1, and April preliminary 99.9; adjusted, March revised, 99.1 and April preliminary, 97.0.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

* Revised.

† New series. See pp. 14-17 of the September 1936 issue for figures for period Jan. 1929-July 1936.

† Revised series. For factory employment revisions beginning January 1934, see table 12, p. 19, of the March 1937 issue. Indexes of department store sales in the Chicago Federal Reserve district, both unadjusted and adjusted, were revised for the period 1923-36. Revision will appear in a subsequent issue.

Monthly statistics through December 1935, together with explanatory notes and refer- ences to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

† Data will be shown when available.

* Revised.

† Preliminary.

* New series. Data for period 1929-36 are shown in table 10, p. 20 of the February 1937 issue.

† Revised series. Anthracite and bituminous coal production revised for years 1935 and 1936. Revisions not shown in the March 1937 issue will be published in a subsequent issue. Series on petroleum and products revised for 1935. See table 14, p. 19 of the April 1937 issue. Series on consumption of gas and fuel oil in the production of electric power revised for 1936. See p. 45 of the May 1937 issue.

* Data on stocks of crude petroleum east of California revised in January 1937, certain stocks formerly included in "tank farms and pipe lines" being transferred to "refineries." December 1936 figures comparable with those shown for January 1937 are, refineries, 39,912; tank farms and pipe lines, 206,497.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

* Revised. †Number of States reporting varies slightly from month-to-month, but the comparability of the series is not seriously affected.

* One company ceased reporting after December 1936. Figure for December 1936 comparable with January 1937 is 110,634.

†Revised series. Production of boots and shoes, for 1936 revisions see p. 46 of the March 1937 issue. Series on retail distribution of gasoline revised for 1935 and 1936. Revisions not shown on p. 46 of the May 1937 Survey will appear in a subsequent issue.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

* Revised.

† Beginning January 1937, the American Iron and Steel Institute computes the percent of capacity on a weekly average basis, with no allowance for Sundays or holidays; the figure shown here will be carried forward on the old basis (which relates daily average output to daily average capacity with allowance for Sundays, July 4, and Christmas) in order to keep the series comparable.

† Revised figures for the first quarter of 1936 are: Production, January, 3,040,000, February, 2,957,000, and March, 3,334,000 long tons; percent of capacity, March, 58.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

† Entire series now being revised by the National Association of Flat Rolled Steel Manufacturers. The data will be shown in the Survey when available.

§ See note marked "§", on p. 50.

† Revised series. Steam, power, centrifugal and rotary pumps, for revisions for period 1919-36 see table 15, p. 19 of the April 1937 issue. For measuring and dispensing pumps, see revisions and explanatory note. See note marked "†" on p. 49 of the April 1937 issue.

* Discontinued by reporting source.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937		1936								1937

[†] Revised.

[†] Monthly data on copper production, shipments, and stocks for months of 1936, comparable with those shown in the 1936 supplement through 1935, are not available. Classifications changed starting in January 1937, but for all practical purposes the series shown are comparable. Classes 4 and 5 are practically equivalent to former class 4; changes made in classes 1, 2, and 3 do not affect the total for the 3 classes as shown here.

[†] Revised series. Data revised for 1936. See p. 50 of the May 1937 issue.

^{*} Revised basis to exclude overestimation of stocks; 5,194 tons formerly included were deducted at the beginning of the year.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

* Revised.

¹ Data no longer collected by the Bureau of the Census.

†Revised series. Data on total rubber consumption, world and United States stocks of rubber, consumption, production and stocks of reclaimed rubber revised for 1935 and 1936. Revisions not shown in the May 1937 Survey, will appear in a subsequent issue. Data for newsprint (Canada) revised for 1936. See p. 52 of the April 1937 issue. Revisions for earlier years on stocks at publishers and in transit to publishers will be shown in a subsequent issue.

Monthly statistics through December 1935, together with explanatory notes and references to the sources of the data may be found in the 1936 Supplement to the Survey	1937	1936										1937

Retail Credit Survey—1936

[Domestic Commerce Series No. 98]

Marked improvement in retail credit throughout the country is shown in the annual **RETAIL CREDIT SURVEY** for 1936. This report covering 1,969 retail establishments in 88 cities shows that customers paid their accounts more promptly in 1936; that installment, open-credit, and cash sales increased; and that bad-debt losses were lower in 1936 than in 1935, and for some trades the lowest since 1929. . . . Data cover the following 14 kinds of retail trade and are presented by cities and regions throughout the country and by size of business: Automobile, Automobile Tire and Accessory, Coal and Wood, Department, Furniture, Grocery, Hardware, Heating and Plumbing, Household Appliances, Jewelry, Lumber and Building Material, Men's Clothing, Shoe, and Women's Specialty. . . . This material should prove of valuable assistance to retailers for the adoption of sound credit policies in the conduct of their credit departments, inasmuch as it provides a basis of comparison of their experiences in charge sales and losses, ratios of collections on receivables, granting of credit, total sales, and installment sales and losses, with those of other retailers in their own trade and community, thus determining the degree of efficiency with which their business is operated.
